

ROBINSPECT · CONTACT UT

Robinspect makes repeatable contact UT on hard shapes simple — integrator path layer, your robot, your UT.

repeatable contact UT on shapes that fight the hand.

A

Integrator

Path + contact UT on hard geometry. No OEM lock.

B

TrajTool

The missing path layer between scan/CAD and the cell.

C

Apple simplicity

Premium calm for robotic NDT — exact, no hype.

THE SQUEEZE

The people who can still do this work are already scarce. An aging craft is walking off the floor — the squeeze gets tighter from here.

The squeeze hits first on nozzles, branch connections, and off-catalog curved welds — where the hand still owns the job.

THE BOTTLENECK

On those shapes, the wrist still owns angle and coupling. Classical cells burn weeks on a path; two same inspections stay hard to compare.

HOW

TrajTool converts scan or CAD into a replayable TCP path. The cell keeps that motion context with the UT record. TrajTool does not drive the robot.

PROOF

Gate 1 proves: recorded contact UT at known fixed speed (≈ 6:04–7:13).

Does not prove: encoder fusion · automated reporting · a client deployment · roadmap.

Revenue = 0. NASA, LSND, and TPAC are not customers.

COMPARABLE OUTPUT

- The arm replays the same coverage.
- Awkward shapes do not restart path work from zero.
- Two inspections become comparable — same path, known speed — not the day's wrist.

NEXT

Bring a part or send a geometry.

Walk recorded Gate 1. Scope a live cell. No close.

Claims: Revenue = 0 · Gate 1 = recorded contact UT at known fixed speed only · no encoder fusion · no automated reporting · no client deployment · no E-2 · TrajTool · Fuzzy Studio · robinspect-systems.com · laser / AI / Florida LLC = roadmap only, not live · NASA / LSND / TPAC ≠ customers · no invented ROI.
